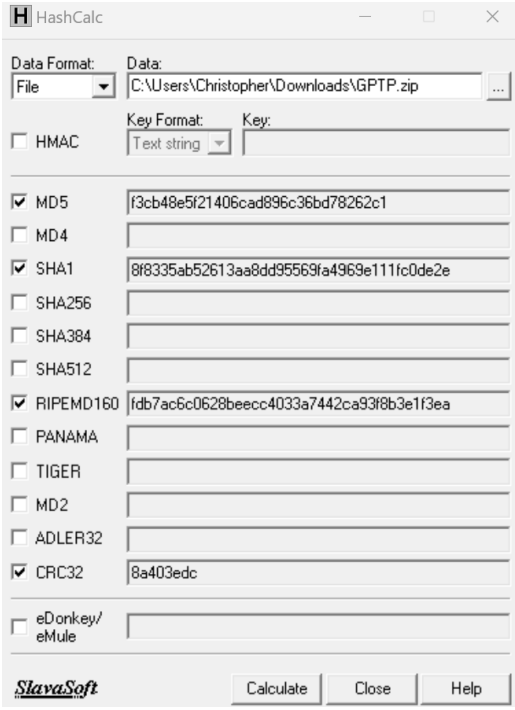
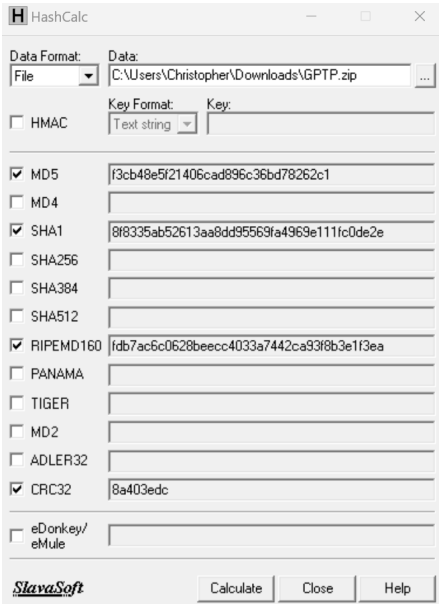
GPT analysis

MD5 and SHA analysis:

This is the file before getting unzipped:



After getting unzipped:



Serial number of the MBR:

The drive serial number is typically not stored in the MBR. It is usually a unique identifier assigned by the manufacturer and stored in the drive's firmware.

Protective MBR:

```
┌──(kali㉿kali)-[~/digitalforensics/Linuxfolder5]
└─$ gdisk GPTPart_HW.001
GPT fdisk (gdisk) version 1.0.9

The protective MBR's 0×EE partition is oversized! Auto-repairing.

Partition table scan:
  MBR: protective
  BSD: not present
  APM: not present
  GPT: present
```

The size of the GPT header is a fixed value and is typically 92 bytes.

```

Conclusion:

I attempted to extract information such as the drive serial number, partition type, disk GUID, CRC32 value, GPT header size, backup header location, last available sector for partitioning, number of possible partitions, and number of defined partitions from the MBR and GPT structures

GPT analysis 1
Serial number of the MBR: 2
Protective MBR: 2
Disk GUID: 2
CRC32: 2
Size of header: 2
Sector congaing backup: 2
Partitions: 3
Conclusion: 3
